## EMAT20920: Numerical Methods in MATLAB

## COURSEWORK ASSESSMENT Jake Bowhay (UP19056)

All figures in this report have been saved using saveFigPDF function as it automatically resizes the paper to the correct size.

```
function saveFigPDF(fileName)
    % saveFigPDF saves open figure as a PDF file
    %
    % Inputs:
    % fileName = File name to save figure as
    % Usage:
    % saveFigPDF("polynomial") -> Saves current figure as polynomial.pdf

    % Get current figure handle
    figureHandle = gcf;
    % Resize paper
    set(figureHandle,'PaperPosition',3*[0 0 6 4]);
    set(figureHandle,'PaperSize',3*[6 4]);
    set(figureHandle,'PaperUnits','centimeters');

    print(fileName,'-dpdf');
end
```

## Question 1: Root-finding

(a) To find how many solutions each equation has in the given domain I will rearrange all the equations to be equal to zero and then looks for the zeros of the rearranged equations. As a corollary to the intermediate value theorem, if a function is continuous and changes sign in a bracket then that bracket must contain a zero. So I will plot each of the rearranged equation and I look for appropriate brackets. I will use the pltFunc function to plot the functions as it removes values outside a defined limit which prevents MATLAB plotting discontinuous functions as continuous. The limits can then be changed using the property explorer to give a more useful plot.

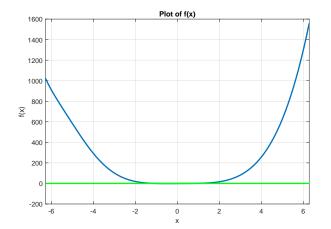

```
% Check xLim is the correct dimensions
assert(isequal(size(domain), [1 2]), "xLim must be a 1x2 vector")

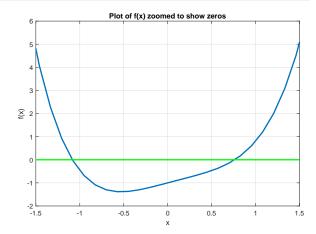

%% Generate values to plot
x = linspace(domain(1), domain(2));
y = f(x);

% Remove large values of y to prevent MATLAB plotting discontinuous
% functions as continuous
y(abs(y)>discontLim) = NaN;

%% Plot function and line x = 0
plot(x, y, [min(x) max(x)], [0 0], "g-", "LineWidth", 2);
xlabel("x");
ylabel("f(x)");
xlim(domain);
title("Plot of f(x)");
grid on;
end
```

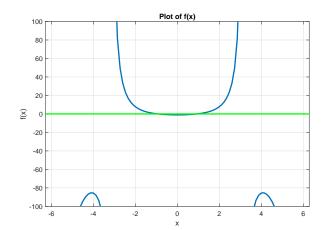

(i) Rearranging  $x^4 = e^{-x} \cos(x)$  gives  $f(x) = x^4 - e^{-x} \cos(x)$ .  $f = @(x) x^4 - \exp(-x).*\cos(x)$ ; pltFunc(f, [-2\*pi 2\*pi], inf);

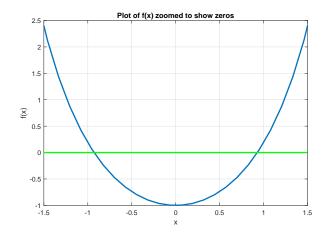

The second zoomed in plot shows there are two zeros in the given domain. The first zero can be bracketed by the interval [-1.5, -1] as f(-1.5) = 4.7455 and f(-1) = -0.4687 so since the function is continuous and there is a change of sign this bracket must contain a zero. Like wise the second root can be bracketed by the interval [0.5, 1] as f(0.5) = -0.4698 and f(1) = 0.8012.

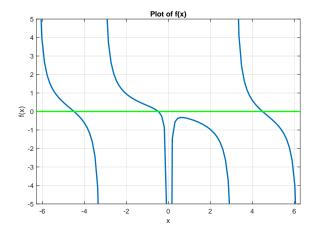

(ii) Setting 
$$f(x) = \frac{x^3}{\sin(x)} - 1$$
.  
 $f = @(x) (x.^3)./\sin(x) - 1$ ;  
 $pltFunc(f, [-2*pi 2*pi], 500)$ ;

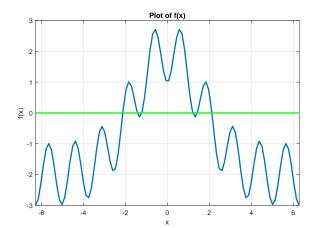

The second plot show there are two roots. The first root can be bracketed by the interval [-1, -0.5] as f(-1) = 0.1884 and f(-0.5) = -0.7393 and f(x) is continuous in this bracket. Likewise, the second root can be bracketed by the interval [0.5, 1] as f(0.5) = -0.7393 and f(1) = 0.1884.

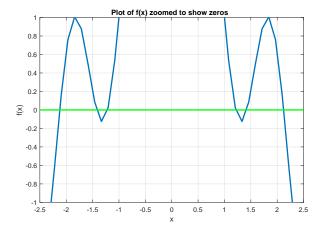

(iii) Rearranging 
$$\cot(x) = \frac{25}{25x-1}$$
 gives  $f(x) = \cot(x) - \frac{25}{25x-1}$ .  
f = @(x)  $\cot(x)$  - 25./(25\*x - 1);  
pltFunc(f, [-2\*pi 2\*pi], 30);

The plot shows that the equation has three solutions. The first can be bracketed by the interval [-5, -4] as f(-5) = 0.4942 and f(-4) = -0.6162. The second solution can be bracketed by the interval [-1, -0.1] as f(-1) = 0.3194 and f(-0.1) = -2.8238. The third solution can be bracketed by the interval [4, 5] as f(4) = 0.6112 and f(5) = -0.4974. f(x) is continuous in each of the bracketing intervals.

(iv) Rearranging 
$$4e^{-x^2/5} = \cos(5x) + 2$$
 gives  $f(x) = 4e^{-x^2/5} - \cos(5x) - 2$ .  
f = @(x) 4\*exp(-x.^2/5) -  $\cos(5*x)$  - 2;  
pltFunc(f, [-2\*pi 2\*pi], inf);

The second plot shows that the equation has 6 solutions. The bracketing intervals are shown in the table below.

[a,b]	f(a)	f(b)
[-2.5, -2]	-1.8518	0.6364
[-1.5, -1.25]	0.2039	-0.0730
[-1.25, -1]	-0.0730	0.9913
[1, 1.25]	0.9913	-0.0730
[1.25, 1.5]	-0.0730	0.2039
[2, 2.5]	0.6364	-1.8518
